Revolutionizing Fleet Maintenance

How Torque By Ryder filled the industry void and transformed the user experience

doublenines.co

Introduction

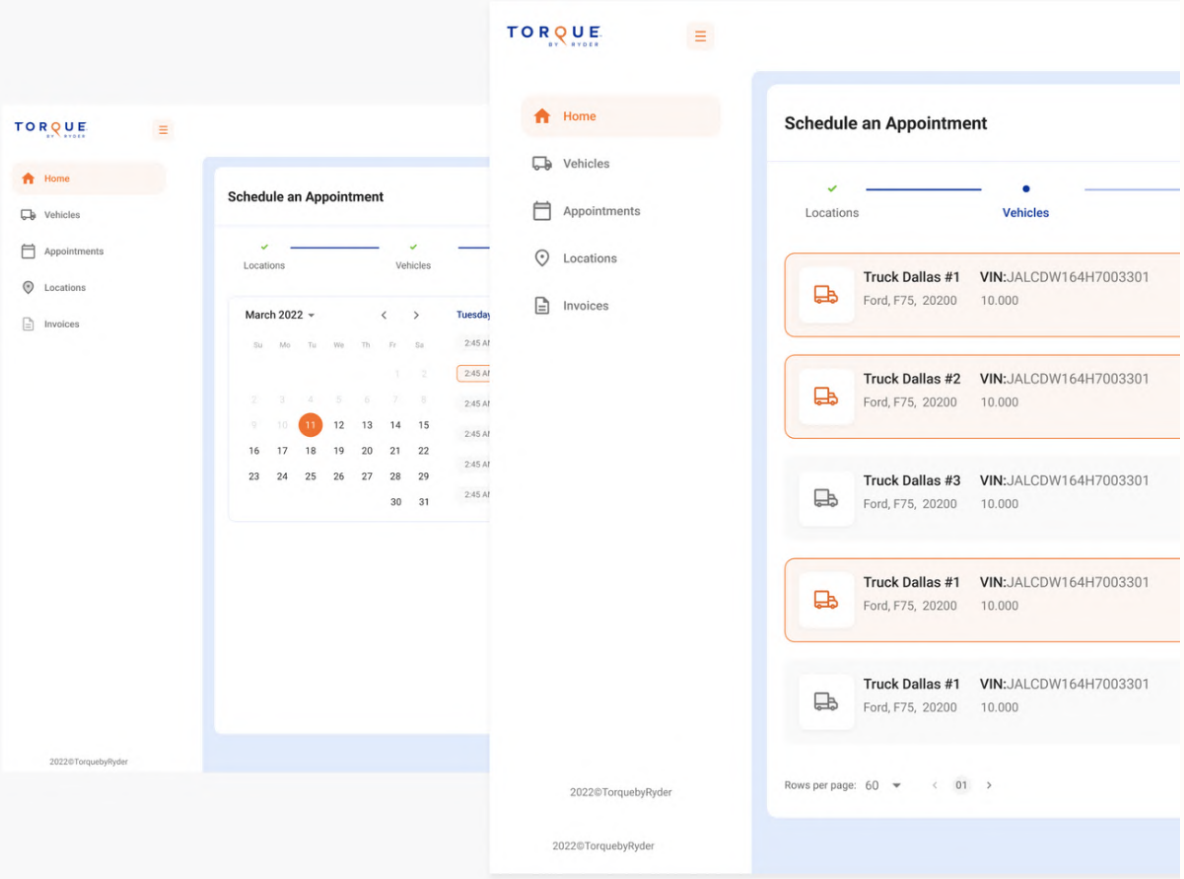
Torque by Ryder started because there was a clear industry demand for a mobile maintenance solution tailored to fleet owners and managers.

Recognizing a noticeable gap between the options of small maintenance shops and costly dealership services, Ryder identified a market void through a comprehensive Boston Consulting Group study.

Taking advantage of the opportunity to address this unmet need, Ryder established a dedicated business unit, poised to cater to this niche in the market.

Ryder created a team pulling resources or hiring from Ryder IT, Ryder Marketing and Ryder Sales Division. Ryder engaged Salesforce to utilize their out of the box solution to support this multifaceted platform.

Double Nines was brought on to lead the product strategy, design and the development of the customer portal.



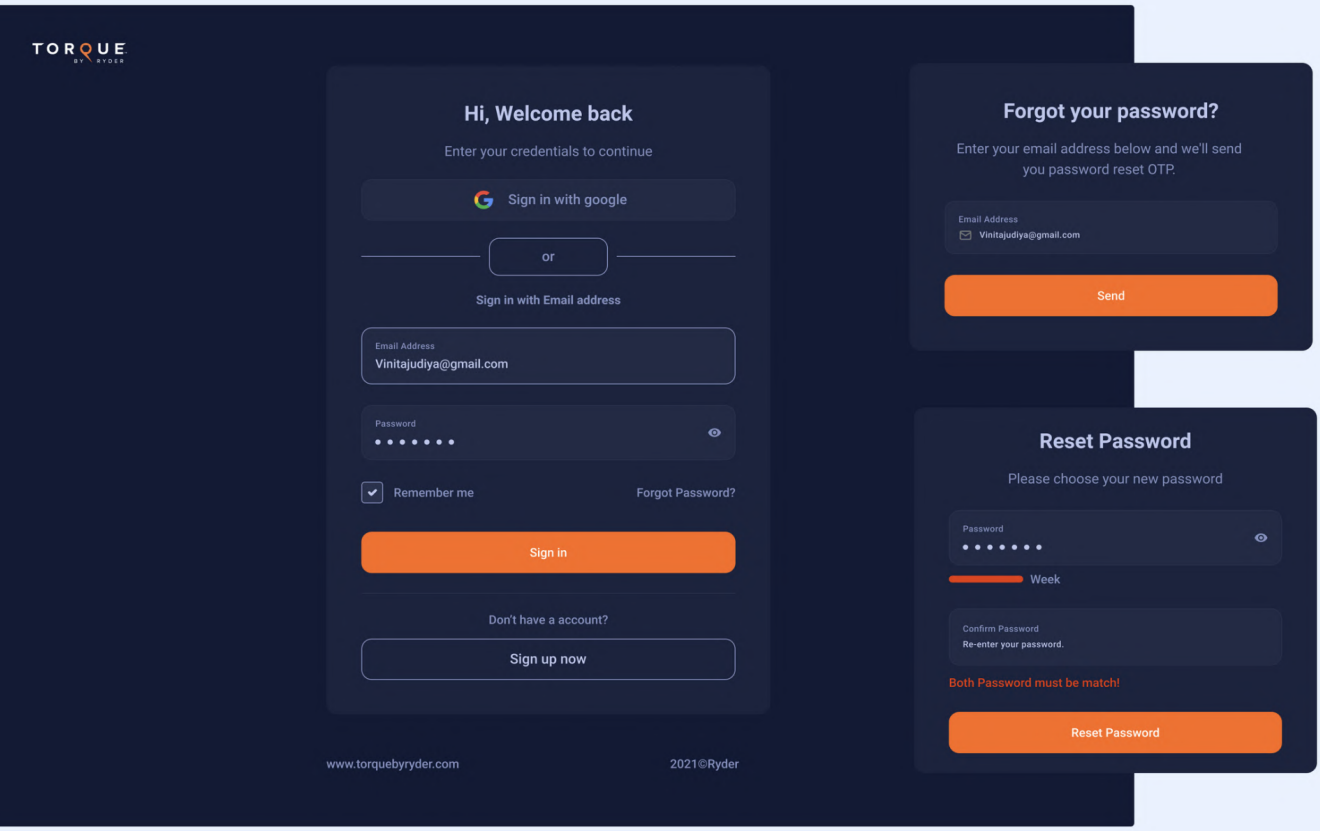
The MVP

The initial request was to build an MVP in three months to be the foundation for the business and to quickly get the platform in front of technicians and the customers.

Double Nines started with some extensive user stories based on Ryder's business requirements.

With the agreed upon user stories, Double Nines moved into user flows for each experience. Once we were aligned on the user flows, we moved into detailed wireframes and high fidelity visual design.

Double Nines then went into developing and testing of the customer portal.



Taking an agile approach, Double Nines embarked on two-week design and development sprints, allowing for iterative build and improvements.
Each sprint culminated in fully realized demos, showcasing the progress achieved within the two-week sprint.

This iterative methodology ensured that the design and development process remained adaptable and responsive to any evolving needs or feedback through the project's lifecycle.

At the outset, the intention was to capitalize on Salesforce's out-of-the-box solutions for constructing the platform.

As we delved deeper into the project, it became evident that these solutions proved insufficient to meet the diverse requirements of the business, resulting in a less-than-optimal user experience for both.

Our strategy enabled multiple options for development

We will contact you as soon as we can.

In response to these challenges, all stakeholders gathered at Ryder Headquarters for a three-day workshop aimed at devising an effective plan.

After careful deliberation, we collectively opted for a change in direction, embracing a headless solution and leveraging Salesforce's APIs.

This strategic shift allowed us to pursue more custom development options, while still leveraging Salesforce solutions through their APIs. As a result, we gained the flexibility to tailor the platform precisely to the business's specific needs, ultimately enhancing the overall user experience for all involved.

Once the chosen direction was set, Double Nines built the Customer Portal against the above-mentioned user stories, user flows and designs.

Achievements & outcome

The headless solution allowed for a more seamless experience for our end users. Double Nines also built TorqueByRyder.com to introduce the business and, subsequently, act as the marketing site for Torque.

The website not only established a strong online presence, but also provided a platform for effectively showcasing the unique benefits and offerings of Torque to a broader audience.

The outcome was that Double Nines went live on time supporting the business launch and we were able to continuously iterate based on the needs of the business and initial customer feedback.

Torque by Ryder started in two market places in January 2022, and has since expanded into 14 market places.
